Plurk Solace is powered by [Solace](#), our open source support software | [API](#)

Stack Overflow?

- It's a clone of Stack Overflow
- Without view tracking and community wiki
- But multilingual
- Creole instead of Markdown (I hate Markdown)
- Completely Open Source (BSD)

Target Audience

- everybody, not just developers
- as a replacement for bulletin boards as well as ticketing systems where useful
- make the “answering” optional to allow it to be used for discussions alone as well
- to be used by companies internally as a discussion place for code and workflows

Technology

- Python 2.5 or higher
- Werkzeug
- Jinja2
- SQLAlchemy
- Creoleparser
- Babel
- jQuery

API

The image shows a Mac OS X desktop with two windows open. The window on the left is titled 'API Response Dump' and contains a JSON dump of a user object. The window on the right is a 'Terminal' window titled 'bash - 80x28 - %4' showing the same JSON data being output from a curl command.

API Response Dump

This is a debug dump of the data exported from this API.

API Request

GET: /api/1.0/users/okano

Internal API handler

api.get_user

```
{  
  "user": {  
    "username": "okano",  
    "downvotes": 6,  
    "#type": "solace.user",  
    "real_name": "",

Coming Up Next

- Xapian and in-database search
- OAuth powered API for write access
- Improved Theme Support
- Plugins?

Cool Stuff

stuff you might want to steal even if you're not interested in Solace at all

solace.utils.formatting

- Implements a Differ for Genshi Streams
- Allows you to add <ins>/ tags around changed Genshi events

...

Blandit tristique bibendum quis ~~nec ante~~, quid post, cursus dolor ad scelerisque at, amet mollis suscipit ipsum conubia magna, lobortis sagittis. Turpis vehicula erat massa odio, nunc nec fringilla nisl, nam sapien gravida sem porttitor viverra. Litora rhoncus sodales euismod, sociosqu risus ut sed ~~lorem~~, solus, fermentum interdum blandit mollis augue inceptos, sociis scelerisque donec rhoncus, accumsan netus. Amet purus nonummy habitant tempor quam litora, consectetur cum pellentesque ornare aliquet sociosqu cras proin, class libero consectetur enim. Massa nostra.

...

Awesome code block

...

solace.i18n

- Mostly a thin wrapper around gettext
- Has a lazy string:

```
>>> from solace.application import Request
>>> from solace.i18n import Locale, lazy_gettext
>>> req = Request.from_values()
>>> x = lazy_gettext(u'Login')
>>> x
lu'Login'
>>> req.locale = Locale('de')
>>> x
lu'Anmelden'
>>> x.upper()
u'ANMELDEN'
```

solace.utils.forms

- modified version of zine.utils.forms
- Form handling with support for nested forms
- Straightforward to use
- Downside: not a separate module because of integration into the i18n system.

solace.utils.forms

```
class RegistrationForm(forms.Form):
    """Used to register the user."""
    username = forms.TextField(lazy_gettext(u'Username'), required=True,
                               validators=[is_valid_username])
    password = forms.TextField(lazy_gettext(u'Password'),
                               widget=forms.PasswordInput)
    password_repeat = forms.TextField(lazy_gettext(u'Password (repeat)'),
                                      widget=forms.PasswordInput)
    email = forms.TextField(lazy_gettext(u'E-Mail'), required=True,
                           validators=[is_valid_email])

    @property
    def captcha_protected(self):
        """We're protected if the config says so."""
        return settings.RECAPTCHA_ENABLE

    def validate_username(self, value):
        user = User.query.filter_by(username=value).first()
        if user is not None:
            raise forms.ValidationError(_('This username is already in use.))

    def context_validate(self, data):
        password = data.get('password')
        password_repeat = data.get('password_repeat')
        if password != password_repeat:
            raise forms.ValidationError(_('The two passwords do not match.))
```

solace.utils.forms

```
{% extends 'layout.html' %}  
{% set page_title = _('Register new Account') %}  
{% block body %}  
    <h1>{{ page_title }}</h1>  
    {% call form() %}  
        {{ form.as_dl() }}  
        {{ form.captcha or '' }}  
    <div class="buttons">  
        <input type="submit" value="{{ _('Register') }}>  
    </div>  
    {% endcall %}  
{% endblock %}
```

WebDepCompress

- Handles static dependencies and the compressing.
- It's in PYPI, YUI integration will follow

I.

```
pack_mgr = PackManager(os.path.join(os.path.dirname(__file__), 'static'),
                       lambda fn, ext: '/static/' + fn))
pack_mgr.add_pack('default', ['layout.css', 'badges.css', 'jquery.js',
                           'babel.js', 'solace.js', 'jquery.form.js',
                           'jquery.autocomplete.js', 'creole.js'])
```

2.

```
  {{ packs.default }}
```

3.

```
  python setup.py compress_deps
```

Django without Django

- The code looks a lot like Django
- Just without using Django
- See Lightning Talk Tomorrow
